

Increasing infrastructure assumptions
↑

Evidence Landscape for Generated-Code Verification

STATIC EVIDENCE

Lexical, syntax, AST, CFG,
operators, identifiers, data flow, APIs
Low cost | broad coverage | weak certification

EXTERNAL EVIDENCE

Retrieval and similar solved programs
when an index or corpus is available
Medium cost | depends on corpus quality

DYNAMIC EVIDENCE

Example tests, full test suites,
runtime behavior, coverage signals
Highest information | highest environment cost

Increasing semantic observability
↑

The design problem is deciding which evidence is worth paying for at each decision point.
